Whitepaper: Documentation Tools & Version Control
Prepared by Dhyaan Satheesh Pisharady

1. LaTeX
A document preparation system based on TeX. It is heavily used in academia for typesetting mathematical formulas, tables, and structured documents. Features include cross-referencing, customizable page styles, and robust equation formatting.

2. Beamer
A LaTeX document class specific to creating presentation slides. It enables the use of overlays, themes, and structured frames while retaining LaTeX's typesetting power.

3. Doxygen
An open-source documentation generator. It parses source code (like C++, Python) for annotated comments and generates comprehensive HTML or LaTeX manuals. It differs from Google Docs by being highly code-centric.

4. Google Docs
A cloud-based collaborative word processor. Ideal for real-time multi-user editing, brainstorming, and business proposals, featuring live comments and version history.

5. Git & GitHub
Git is a distributed version control system that tracks file changes over time, enabling branches and merges. GitHub is a hosting platform that adds code review (Pull Requests), issues, and collaborative project management.
